

# Full Sense Device

- Randal S Baker MD FACS
- Grand Rapids, Michigan USA

# Clinical Considerations

- More direct and continuous than food based scenario
- No non-responders in any study
- Patients continue to lose weight until device is removed (75% mean EBWL at 6 months)
- Long Term Implant will requires adjustability
- Greater EBWL represents less chance for weight regain
- Significant satiety at baseline and fullness with eating and drinking

# Potential Benefits

- No incisions
- Outpatient sedation only potential
- Service overweight and obese population
- Children and adolescents
- More cost effective
- Offer second chance to post bariatric patients who have regained weight.
- Safer and less invasive thus more readily adopted by population

Bariatric Surgery Only Impacting Around 1% of Eligible Patients since the other 99% choose not to have surgery.
